GENERIC PATIENTS PROFILE IN OMNICELL STANDARDIZATION – OMNICELL

OVERVIEW

Starting Jan 6, 2022

- ▶ **NICU and Medical Imaging (T1)** will have new **generic patient** profiles to remove medication from Omnicell. This is used instead of creating a temporary patient **when patient identifiers are unknown**.
- ▶ NICU: *unknown baby, NICUT2A
*unknown baby, NICUT2B (etc.)
- ▶ Medical Imaging (T1): *unknown pt, Med Imaging

KEY PRINCIPLES

- Whenever possible, use patient from the patient list to remove medications (not available in MI)
- If patient is unavailable but specific patient information is known (including name and one additional identifier including DOB or MRN), continue to create a temporary patient with known details
- When no information is available, but preparation of the medication in advance is necessary, use the new generic patient profile instead of creating a new non-specific temporary patients. *Narcotics and BOTS are not to be removed under this profile.*
